

HYDROPHONIC FODDER MACHINE

We are engaged in manufacturing & supplying a wide range of Hydroponic Green Fodder Machines (HGF). HGF is much more nutritious compared to the open field grown wheat grass or maize in soil. Since this is only grown in water with no soil, there is no need to clean the roots grass. The hydroponic fodder machine concept is highly accepted by the farmer owing to its extremely low Operating cost. A selection of seeds or grains is spread onto the specialized growing trays, which are hosted inside the vertical farming method. Trays are watered at pre-determined intervals with Four Way Foggers.

Fresh green feed (fodder) produced by the Hydroponic Machine have following benefits:

- Superior feed supplement. Cattle love it!
- Milk yield- production can increase by 15 to 20%
- Green shoots contain essential nutrients
- Roots provide essential fiber
- Pesticide free
- Weight gain
- Increase in fertility rates
- 100 % Organic
- Increased immunity levels etc...
